*In April 2020 MSD Animal Health launched the NOBIVAC® Myxo-RHD PLUS Vaccine. This vaccine protects against myxomatosis and BOTH strains of RHD (RHD1 and RHD2) and is effective for 12 months.

RABBITS NEED VACCINATIONS TO PROTECT THEM AGAINST MYXOMATOSIS, RHD1 & RHD2. BOTH INDOOR AND OUTDOOR RABBITS NEED TO BE VACCINATED.

Myxomatosis is caused by the myxoma virus and is spread through close contact and biting insects. This distressing disease is highly contagious with up to 100% mortality rate.

Rabbit Haemorrhagic Disease is caused by either classical or variant strains of RHD (RHD1 and RHD2). Both strains are highly contagious and spread in many ways including on clothing and footwear. RHD1 rapidly leads to a high level of mortality, RHD2 has a longer disease course meaning it spreads even more widely than RHD1. Both diseases may show no initial symptoms, leading to apparent sudden mortality.
